## PREFACE

The National Institute of Urban Affairs was entrusted with a study "to determine the expected level of services (water supply and drainage system, roads, and primary education) in the municipalities of the State and to work out, on a scientific basis, the financial requirements for upgrading the level of services to the said expected levels after taking into consideration the present levels of these services in the municipalities ..." (Annexure 1). The study was undertaken on behalf of the Urban Development and Urban Housing Department of the Government of Gujarat (vide Resolution No. MFB-1083-1545-F dated 12 January 1984).

In order to provide an empirical base for the study and to avoid straying into the realm of pure academics, the National Institute of Urban Affairs and the Gujarat Municipal Finance Board together agreed that (i) the Institute would prepare a questionnaire for collection of basic data on the services mentioned from the 58 municipalities and corporations which were to comprise the universe for the study, (ii) the Gujarat Municipal Finance Board would canvass the questionnaire, collect data from the corporations and municipalities, and also scrutinise the same before furnishing it to the Institute, (iii) the Institute would process and analyse the data for purposes of determining the existing levels of services, and (iv) in deciding upon the norms for the (expected) level of

services, the Institute would take into consideration the views of the Board.

It was further agreed that the norms for the services should relate to the year 2001 AD (and 2011 AD, in the case of water supply and sewerage), and consequently the financial requirements for upgrading the levels of services of the corporations and municipalities will relate to the same year.

Central to the study has been the question of the norms for water supply and sewerage, roads, and primary education, in particular, the factors that ought to be used in determining them. The most widespread practice so far has been to use the norms laid down in the 1963 Report of the Committee of Ministers, known as the Zakaria Committee Report on AUGMENTATION OF FINANCIAL RESOURCES OF URBAN LOCAL BODIES. These norms have usually formed the basis for estimating the resources required for providing and maintaining the municipal services.<sup>1</sup>

Taking note of the fact that very few corporations and municipalities have been able to attain the levels as laid down in the Zakaria Committee Report, and that the

---

1. Augmentation of Financial Resources of Urban Local Bodies - Report of the Committee of Ministers constituted by the Central Council of Local Self Government, November, 1963, under the chairmanship of Dr. Rafiq Zakaria.

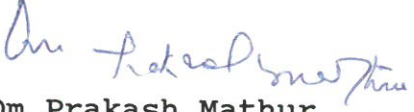

attainment of these levels even if attempted by municipalities, would inevitably impose a heavy, and possibly out-of-reach financial burden on the States and the urban local bodies, the Institute has adopted somewhat lower but more pragmatic and attainable standards of services. In arriving at these standards the Institute has taken into account not only the population size and functional category of the corporations and municipalities, but also their location -within the context of the State, and their capacities to provide and maintain the services. Also, as stated above, the Institute has considered the views of the Gujarat Municipal Finance Board in arriving at these norms.

This study which is titled MAINTAINING GUJARAT'S MUNICIPAL SERVICES : A LONG RANGE PERSPECTIVE, provides, in the final analysis, estimates of resources that would be required by the 58 corporations and municipalities to upgrade their services to the proposed levels. The study also attempts to provide for guidance broad city-wise outlines of services and resource requirements.

In a sense, this study is the joint product of the National Institute of Urban Affairs and the Gujarat Municipal Finance Board. Apart from the sharing of work, the Institute and the Board maintained throughout the period of the study close contacts and a continuing dialogue, sorted out the problems of data inconsistency, wherever necessary,

and worked jointly on the question of norms. The National Institute of Urban Affairs alone, however, is responsible for the analysis and conclusions of the study.

October, 1987

## I APPROACH TO THE STUDY

The approach to the study was guided by two general considerations :

- i. the outcome of the study should be realistic; it was important to keep in mind the existing levels of services as well as the resource position of the corporations and municipalities; and
- ii. the methodology to be employed in the study should be widely replicable.

Within the ambit of these general considerations, the study was designed in six interrelated phases :

- i. Delimiting the scope of the study

At the starting point, the scope of the study was concretised and delimited, particularly in view of the fact that it was a complex and wide field and has been the subject of extensive review and examination in the country since 1833.[2] Thus, the study was limited to only four municipal services, namely, water supply and drainage, roads, and primary education which happen to be the most important obligatory functions of the corporation and municipalities under the Gujarat Municipalities Act, 1963. In terms of the spatial coverage, the study was extended to 58 towns and cities\* of Gujarat which enjoyed the status of either a corporation or municipality. The remaining 197 towns were excluded from the study.

- ii. Preparation of a questionnaire

A questionnaire was developed with two objectives : (a) to clearly indicate the actual levels of municipal services, and (b) to assist in the proper appreciation of the physical and environmental constraints so that the entire question of upgrading the levels of services could be examined within the parameters of those constraints.

---

2. Huge Tinker, The Foundations of Local Self Government in India, Pakistan and Burma.

\* The terms "towns" and "cities" have been used interchangeably.

iii. Data collection and scrutiny

Along with the preparation of a questionnaire which sought to collect data directly from the towns and cities, the study provided for collection of two other types of data. These included (a) time-series population data of the 58 towns, and (b) information on norms or the levels of services and unit costs proposed by various committees and departments. Scrutiny of data particularly to weed out the inconsistencies formed an important element of the study design.

iv. Data compilation and analysis

In order to gain an indepth understandingi of problems encountered by the 58 towns, the study provided that the entire field data should be compiled and analysed with respect to three variables, namely : (a) population size category, (b) functional grouping, and (c) location of the towns. The purpose was to ascertain the extent to which the levels of services varied by either size or functional category of towns or their location.

v. Determination of the 'norms' for the levels of services

Two sets of data were utilised for dertermining the norms for services for the year 2001 that is (a) the actual existing levels which became available from the questionnaire, and (b) norms proposed by the Zakaria Committee which represented, in a sense, the "desirable" levels that the municipalities of various sizes or types should have. In addition, at least two additional sets of criteria were considered :

- the proposed levels of services should be low-cost and affordable; and
- a gradual upgradation in the levels of services should be preferred over a single-shot jump in the level in the year 2001.

The study also provided for detailed discussions with the technical heads of the various departments of the Government of Gujarat on the technical and administrative feasibility of upgrading the serices to the proposed levels. In addition, norms for the unit costs for upgrading the services were also developed by taking into account the existing levels of costs.

vi. Report preparation

Initially, the Institute provided a draft report for discussions and review by the Gujarat Municipal Finance Board Based on their comments, this report has been finalised and submitted to the Gujarat Municipal Finance Board.

As mentioned above, the study is aimed at estimating the financial requirements for upgrading the services in the 58 corporations and municipalities to the levels proposed. It required the estimates of population for each of these towns for the year 2001, (2011 in the case of water supply and sewerage), and also for the intermediate year of 1991. In order to arrive at the most realistic estimates of population, the population projections carried out by the Operations Research Group (ORG) were also examined by the Institute. Taking note of the fact that the GMFB/State Government have used the ORG's population estimates, the same have formed the base for this study as well. These are given in Table IA. Also shown in the same statement are (i) the changes in the population size classification for the years 1991, 2001 and 2011, (ii) functional classification, and (iii) region of their location.

## II PRESSURE OF POPULATION GROWTH ON URBAN AREAS

If there is one single factor whose impact is immediately felt on the availability of essential services such as water supply and sewerage, roads and education, it is population growth. Experience in India as elsewhere shows that as a result of the disproportionately high population growth rates registered by most urban areas, the overall availability of services seems to have declined. Many studies show that cities are in a crisis as the demand for services which is related directly to population has increased much faster than their supply. This section examines the pressures of population growth on the 58 towns and cities forming part of this study.

The process of urbanisation in Gujarat has been remarkably consistent since the census decade 1961-71 when compared with its trend in earlier decades, and also in comparison with several other larger states. Since 1961, it has maintained its ranking, the third highest urbanised state in the country. During 1971-81, its urban population increased by 41.42 per cent; in the preceding decade, it had risen by 41.0 per cent.

Table - 2

### Decennial Growth Rate Percentage - All India (Selected States)

| State       | 1971-81 | 1961-71 |
|-------------|---------|---------|
| Gujarat     | 41.42   | 41.00   |
| Maharashtra | 39.99   | 40.75   |
| Tamil Nadu  | 27.98   | 38.64   |
| Karnataka   | 35.23   | 50.65   |
| Punjab      | 44.51   | 25.27   |
| West Bengal | 28.41   | 31.73   |
| All India   | 46.39   | 38.32   |

Two features of the process of Urbanisation in Gujarat are particularly important to be noted.

- i. While it is a fact that the overall urbanisation process has been consistent, there are sharper variations within the State. For instance, the urban population growth rates in the Saurashtra region covering Jamnagar, Rajkot, Surendranagar, Bhavnagar, Amreli, Junagadh and Kachchh districts are without exception lower than the state average for 1971-81. In comparison, the urban population of Sabar Kantha, Ahmedabad, Vadodara, Surat and Valsad District have registered higher than the state average growth rates for two successive census decades.

Table - 3

Decennial Population Growth Rate of Gujarat by Region  
(per cent)

| Districts                               | Urban population growth rates |         |
|---|-------------------------------|---------|
|   | 1971-81                       | 1961-71 |
| <u>Saurashtra Region</u>                |                               |         |
| Jamnagar                                | 32.92                         | 33.63   |
| Rajkot                                  | 38.68                         | 33.17   |
| Surendranagar                           | 30.08                         | 22.99   |
| Bavnagar                                | 39.14                         | 27.58   |
| Amreli                                  | 30.58                         | 18.36   |
| Junagadh                                | 31.66                         | 38.15   |
| Kachchh                                 | 27.94                         | 58.81   |
| Region Average                          | 34.36                         | 32.76   |
| <u>North Central &amp; South Region</u> |                               |         |
| Sabar Kantha                            | 43.04                         | 69.85   |
| Ahmedabad                               | 42.93                         | 44.82   |
| Vadodara                                | 57.58                         | 51.75   |
| Surat                                   | 76.89                         | 67.15   |
| Valsad                                  | 51.65                         | 41.16   |
| Region Average                          | 52.00                         | 39.06   |

- ii. The population pressure as measured by the growth rate is significantly higher in cities with 100,000+ population. Smaller cities have a comparatively lower pressure as may be seen in the following table (Table 4).

Table - 4

Decennial Growth Rate of Urban Settlements by Census Size Class

| Size Class | No. of urban settlements 1981 | Urban population 1971-81 | No. of urban settlements 1971 | Growth rates 1961-71 |
|------------|-------------------------------|--------------------------|-------------------------------|----------------------|
| I          | 13                            | 67.08                    | 8                             | 55.82                |
| II         | 23                            | 32.85                    | 17                            | 52.72                |
| III        | 46                            | 19.75                    | 37                            | 8.21                 |
| IV         | 76                            | 12.76                    | 66                            | 50.84                |
| V          | 53                            | -21.06                   | 66                            | 15.29                |
| VI         | 9                             | 29.51                    | 4                             | -51.17               |

The present study is confined to 58 cities and towns of various sizes. They constitute 22.75 per cent of the total number of urban local bodies (225), and 72.7 per cent of the State's urban population of 10,601,653. The distribution of the 58 cities by population size and growth rate is shown below (Table 5).

Table - 5

Decennial Municipal Population Growth Rate by Size Class

| Size Class                          | 1981         | % Growth Rate |
|-------------------------------------|--------------|---------------|
| I (a) Corporation                   | 6 4,600,593  | 41.57 45.24   |
| (b) Others (Grade A municipalities) | 6 698,687    | 29.21 30.85   |
| II (Grade B municipalities)         | 27 1,564,664 | 35.02 35.64   |
| III (Grade C Municipalities)        | 19 844,655   | 26.20 21.06   |
| Total                               | 58 7,708,599 | 37.20 38.46   |

The pressure of population has been high in at least seven out of the 58 municipalities and corporations of Gujarat which includes Surat and Vadodara corporations, and the four B municipalities of Sahijpur Bogha, Gandhidham, Upleta and Botad. These registered during 1971-81 a population growth rate of over 50 per cent. At the other extreme were 30 towns whose growth rates were less than 30 per cent, suggesting, at least on prima facie considerations, that the population pressure on them for availability of basic services may not have been that intense. The overall distribution of towns according to population growth rates is given in the following table (Table 6).

Table - 6  
Distribution of Towns by Size Class

| Size Class                 | 1971-81 Decennial growth rate % |       |       |       |       |     |
|----------------------------|---------------------------------|-------|-------|-------|-------|-----|
|                            | 50+                             | 40-50 | 30-40 | 20-30 | 10-20 | <10 |
| I Corporations             | 2                               | 1     | 2     | 1     | -     | -   |
| II Grade A Municipalities  | -                               | 1     | 2     | 2     | 1     | -   |
| III Grade B Municipalities | 4                               | 5     | 4     | 10    | 1     | -   |
| IV Grade C Municipalities  | 1                               | 2     | 4     | 7     | 8     | -   |
| Total                      | 7                               | 9     | 12    | 20    | 10    | -   |

On yet another count, population pressure in Gujarat municipalities cannot be said to have caused any undue pressures on municipal services. During the period 1971-81 when urban population increased by an average growth rate of 37.2 per cent,

the municipal incomes and expenditure too recorded an extraordinarily high increase. According to the data contained in Statistics of Municipal Bodies, Gujarat and other sets of data obtained from the Gujarat Municipal Finance Board, the incomes of the municipalities rose by over 173.14 per cent during 1971-72 to 1981-82. The increase in municipal expenditure in the corresponding period was 331.08 per cent.

Table - 7

Decennial Income and Expenditure Variation

| Item  | (Rs. in 000) |           |                         |
|---|--------------|-----------|-------------------------|
|   | 1971         | 1981      | Decennial Growth Rate % |
| Population                                  | 5,618,420    | 7,708,599 | 37.20                   |
| * Ordinary municipal incomes ('000)         | 581,932      | 1,597,710 | 173.14                  |
| * Ordinary municipal expenditure ('000 Rs.) | 357,011      | 1,539,009 | 331.08                  |

\* The figures relate to the years 1971-72, and 1981-82

Source : Statistics of Municipal Towns and Cities - Gujarat : 1971-72 and 1972-73; Statistics of Municipal Bodies - Gujarat : 1981 (GMFB)

In six municipalities which experienced relatively high growth rates,\*\* the increase in municipal incomes and expenditure was equally high, in fact, significantly higher than the overall average for the 58 municipalities, as may be seen below (Table 8).

\*\* Surat, Vadodara, Sahijpur Bogha, Gandhidham, Upleta and Botad

Table - 8

Change in Municipal Income and Expenditure  
between 1971-72 and 1982-83

(per cent)

| Town       | Income | Expenditure |
|------------|--------|-------------|
| Surat      | 370.72 | 848.76      |
| Vadodara   | 468.20 | 888.96      |
| Gandhidham | 389.96 | 497.04      |
| Upleta     | 145.78 | 209.37      |
| Botad      | 215.86 | 272.59      |

Source : Same as in case of Table - 7

Increase in salaries and allowances do not seem to be the main factor for this extraordinary increase in municipal expenditure and incomes. Allowance of course, needs to be made for inflation. But on the whole, it can be said that the pace of urban growth in Gujarat has not been such as to have created any special problems for the municipalities maintaining the existing levels of services. Ordinary incomes and expenditures rose at a sufficiently high rate during this period, refuting the oft-repeated notion that the municipalities do not raise their incomes and expenditures, causing a decline in the level of services.

### III ACTUAL LEVELS OF SERVICES A MACROVIEW

Any attempt to assess the actual levels of services is fraught with both methodological problems and problems of data availability. For instance, a town's installed capacity of water may be x million/ld; however, there could be wide variations between the installed capacity and the quantity of water that is released from the system, and the quantity that actually reaches the population. There are leakages and wastages within and outside the system which affect the availability of water for the population of a particular town. The overall area under roads may be as high as 25 per cent of the town's total developed area; however, the effective area may be much less on account of encroachments, and so on. Then, there are very wide variations in the supply of services within the jurisdiction of towns. Besides, there are factors such as the source of water supply, and type of delivery system which also affect the actual levels of services. Therefore, any assessment of the actual services remains, to a very large extent, an approximation.

As stated earlier, this study has covered only four municipal services, namely : water supply, drainage, roads and primary education. In order to gain a proper understanding of the existing levels of services, a set of indicators has been developed and utilised :

Water Supply

- i. Per capita daily average availability of water.
- ii. Per capita average availability of size of towns.
- iii. Per capita average availability by functional character of the towns.
- iv. Per capita average availability by towns located in the three sub-regions of Gujarat namely : North and Central Gujarat, South Gujarat, and Saurashtra and within these sub-regions.

Sewerage

- v. Per cent of town's population and area served by underground sewerage system, and surface drainage system : overall and by size.
- vi. Per capita sewage (ltrs/day) actually disposed of : overall, and by size.
- vii. Per capita garbage (grams) actually collected : overall and by size.

Roads

- viii. Road length per sq. km. of area, total, surfaced and unsurfaced.
- ix. Road length per sq.km. of developed and total area by size class.

Education

- x. Enrolled students in primary classes as a per cent of total population in 6-11 year age-group;
- xi. Number of students/class room (per shift)  
- Student-teacher ratio.

Data with respect to these indications are analysed below.

Water Supply

The Gujarat Municipalities Act, 1963 lays down that it shall be the duty of every municipality to make reasonable and adequate provision for the supply or an additional supply of water, and for the protection of the health of the inhabitants from the insufficiency or "unwholesomeness of the existing supply, when such supply or additional supply can be obtained at a reasonable cost ....". Accordingly, all corporations and municipalities in Gujarat carry out this function, adequately or otherwise.

Two preliminary points about the water supply system in Gujarat need to be stated at the outset. The first point is that of the 58 municipal areas, 36 rely on a single source of water, either surface (7) or underground (29). The remaining 22 towns have access to either both sources of water supply or depend on bulk purchases and so on. The second point to be noted is the age of the water supply system in the 58 cities/towns which varies between less than 11 years for two municipalities and over 90 years in the case of three municipalities. The age of the system is shown in Table - 9.

Table - 9

Age of the Water Supply System

| Age of the system (in years) | Number of municipalities |
|------------------------------|--------------------------|
| <11                          | 2                        |
| 11-30                        | 33                       |
| 31-60                        | 16                       |
| 61-90                        | 3                        |
| 91+                          | 3                        |
| Total                        | 57*                      |

\* Data relating to Godhra not available.

The overall average per capita water supply in the 58 municipalities and corporation works out to 139.4 ltrs/day. It ranges between a low of 14.5 ltrs/day for Veravalpattan, a fishing town which presumably relies for its water supply directly on the source, and 203.65 ltrs/day for Vadodara corporation, the third largest city in the state of Gujarat.

The distribution pattern of per capita water supply shows that 15 municipalities and corporations enjoy an average supply of over 125 ltrs/per day, and another 24 municipalities between 75-125 ltrs/day. Among those where supplies are on the lower side, that is, less than 50 ltrs/day are included 10 municipalities : Veravalapattan (14.5) Mangrol (43.96), Gondal (42.7), Palanpur (43.8), Amreli (31.13), Botad (36.12), Sawarkundla (27.51), Wankaner (44.89), Mandvi (44.57), and Limbdi (24.37). (Table 10).

Table - 10

Water Supply Distribution

| Water supply (lpcd)   | Number of municipalities |
|-----------------------|--------------------------|
| 01 - 25               | 2                        |
| 26 - 50               | 8                        |
| 51 - 75               | 9                        |
| 76 - 100              | 15                       |
| 101 - 125             | 9                        |
| 126 - 150             | 13                       |
| 150 +                 | 2                        |
| Overall average 139.4 | 58                       |

In order to properly appreciate what lies underneath these overall averages, and to obtain indicators for developing norms, we have examined five types of questions :

- i. Is the per capita availability of water supply higher in relatively large-sized cities? In other words, what exactly is the relationship between the per capita availability and the size of cities/towns?
- ii. Does the per capita availability change with the industrial character of the towns? More specifically, is it consistently higher in "industrial towns", and lower in others?
- iii. What is the effect of the natural factors on the per capita availability of water? (e.g., abundant versus scarce supply)
- iv. Does the per capita availability of water differ with the "source" of water supply?
- v. Does it have any connection with the sewerage/water disposal system in vogue in the area?

Data on water supply have been arranged and analysed to address the above questions. Table 11 below gives the data on the availability of water supply by size of cities.

As will be noted, the data substantiate the generally held notion that the per capita availability of water supply is higher in large-sized cities and towns, which declines as the city-size decreases. Proportions are important to note. Per capita availability in cities of 200,000+ size is 1.6 times higher than the availability in 100,000-200,000 sized cities, but this difference narrows down and becomes more or less attenuated as there is a limit below which per capita availability cannot decline, this being the basic minimum for survival.

This pattern is also sustained when domestic supply is taken into account. Domestic water supply averages are higher for the corporations, and lower for relatively small-sized municipalities.

Table - 11

Total and Domestic Water Supply Distribution  
by Size Class (1983-84)

| Size class               | Actual quantity supplied (Total) |        | Actual quantity supplied (Domestic) |        |
|--------------------------|----------------------------------|--------|-------------------------------------|--------|
|                          | (mld)                            | (lpcd) | (mld)                               | (lpcd) |
| Corporations             | 868.79                           | 172    | 529.24                              | 105    |
| Class A                  | 74.28                            | 98     | 61.25                               | 81     |
| Class B                  | 154.41                           | 90     | 106.54                              | 62     |
| Class C                  | 78.23                            | 83     | 59.24                               | 62     |
| Total                    | 1175.71                          | 139    | 756.27                              | 89     |
| Number of municipalities | 58                               |        | 49                                  |        |

mld : million litres per day. lpcd : litres per capita per day.

Variations in the availability of water supply are also noted with differences in functional category. Towns with a pronounced industrial character enjoy an overall average per capita of 179 ltrs/day, almost 1.23 times higher in comparison with multifunctional towns and 1.37 times higher than those whose main function is service (Table 12).

Table - 12

Per Capita Water Supply (Total) by Functional Category

| Functional category  | Actual quantity supplied |      |
|----------------------|--------------------------|------|
|                      | mld                      | lpcd |
| Industry (8)         | 616.03                   | 179  |
| Serevice (2)         | 25.60                    | 124  |
| Primary (2)          | 5.49                     | 66   |
| Multifunctional (45) | 521.93                   | 112  |
| Commerce (1)         | 7.00                     | 127  |
| Total (58)           | 1175.71                  | 139  |

It is also to be noted that on an average, the towns located in the Kachchh of Saurashtra region in particular and the region as a whole which is a water scarcity region, have a lower per capita availability of water supply. The average per day is 86 ltrs for Kachchh District and 108 ltrs for this region as compared to 103 and 141 ltrs for towns in, North and Central Gujarat, respectively and 171 ltrs. for South Gujarat towns.

Table - 13

Per Capita Water Supply Distribution (Total) by Region

| Functional category  | Actual quantity supplied |        |
|----------------------|--------------------------|--------|
|                      | mld                      | lpcd   |
| North Gujarat (9)    | 55.07                    | 103.00 |
| Central Gujarat (12) | 510.44                   | 141.00 |
| Saurashtra (22)      | 234.76                   | 108.00 |
| South Gujarat (11)   | 355.78                   | 171.00 |
| Kachchh District (4) | 20.00                    | 86.00  |

The conclusions that emerge from the data on actual level of services are that (i) on an average, large-sized cities have higher levels of per capita availability of water, (ii) towns

with industrial dominance again have higher levels, and (iii) those towns which are located in the Saurashtra region have lower per capita.

Table - 14

Per Capita Water Supply for Sewered towns by Size Class

| Size Class                         | Water supply for the sewered towns (lpcd) | Overall (lpcd) |
|------------------------------------|---|----------------|
| Corporations & towns with 200,000+ | 177                                       | 172            |
| 100,000 - 200,000                  | 116                                       | 98             |
| 50,000 - 100,000                   | 75  | 90             |
| 20,000 - 50,000                    | 95  | 83             |
| Total                              | 149.                                      | 139            |

According to Table 14, there seems to be a positive relationship between the average water supply per capita and the sewerage system in that the average per capita water supply in sewered towns is higher than the overall average except for the class B towns. But the adverse effect of lower per capita water supply in class B towns vis-a-vis the overall higher per capita of sewered towns cannot be ignored as this class bags 11 of the 22 towns having sewerage systems.

Sewerage

The waste disposal system can be divided into three broad categories, namely (i) a sewerage which is meant to collect used water and sullage and other wastes, (ii) a drainage system to collect surface water from the open streets and areas, and (iii) garbage disposal for collection of dry refuse, and solid waste materials.

Of the 58 municipalities in the state, 22 have sewerage systems. Table 15 shows class-wise distribution of the sewerage system.

Table - 15

Sewerage System by Size Class

| Size Class   | Municipalities* |                        |
|--------------|-----------------|------------------------|
|              | Total number    | Having sewerage system |
| Corporations | 6               | 4                      |
| Class A      | 6               | 2                      |
| Class B**    | 27              | 8                      |
| Class C**    | 19              | 8                      |
| Total        | 58              | 22                     |

\* Also refer to Table - 47

\*\* These towns are : Anand, Bhuj, Khambhat, Goudal, Gandhidham, Upleta, Mahuva, Botad, Sawarkundla, Sardarnagar, Viramgaon, Dhaboi, Billimora, Borsad, Kapaduanj and Unreth.

With the exception of Rajkot and Jamnagar all the corporations have sewerage systems.

16. Of the 22 municipalities and corporations which have sewerage systems, 21 have furnished data on the population and area coverage.

Table - 16

Area and Population Coverage by Sewerage as per Size Class

| Size class | Number of responding municipalities | Population served ('000) |            | Area Served (sq.km.) |            |
|------------|-------------------------------------|--------------------------|------------|----------------------|------------|
|            |                                     | Actuals                  | % to total | Actuals              | % to total |
| M.C.       | 4                                   | 3289                     | 76.10      | 181.00               | 51.40      |
| Class A    | 2                                   | 171                      | 62.20      | 16.60                | 44.90      |
| Class B    | 10                                  | 31116                    | 48.02      | 69.54                | 49.65      |
| Class C    | 5                                   | 128                      | 64.60      | 30.80                | 32.70      |
| Total      | 21                                  | 3894                     | 71.62      | 297.94               | 48.58      |

As can be seen the coverage of Gujarat towns and municipalities by the sewerage system is rather low. Even in the four corporations which have furnished data, the sewerage system on an average covers 76.1 per cent of the population, and 51.4 per cent of the area.

That the sewerage system is grossly inadequate is borne out by the fact that only four towns and cities have the minimum per capita water supply of 140 ltrs/per capita per day to efficiently operate the sewerage system. These included the three corporations of Ahmedabad, Surat and Vadodara, and one class B municipality of Valsad. Even if this norm is lowered to 100 ltrs/per capita, only about a fourth of the total number of towns would seem to have effective sewerage system.

It is equally important to note that even with the supplementation of the sewerage system by surface drains, the situation with regard to the overall environmental hygiene cannot be said to be satisfactory in Gujarat's 58 towns and cities. According to the data, the drainage system covers not more than 60 per cent of the area in as many as 26 towns (out of the 38 towns which have responded). More or less the same situation is obtained in terms of population coverage also. Data on a few cities are interesting to take note of.

Table - 17

Area and Population Coverage by Sanitation of Select Towns

| Name         | % of area served |                      | % of population served |                      |
|--------------|------------------|----------------------|------------------------|----------------------|
|              | Surface drains   | Underground sewerage | Surface drains         | Underground sewerage |
| Ahmedabad    | -                | 92.00                | -                      | 94.00                |
| Surat        | 6.00             | 21.00                | 8.00                   | 53.00                |
| Vadodara     | 50.00            | 58.00                | 34.00                  | 68.00                |
| Rajkot       | 58.00            | -                    | 64.00                  | -                    |
| Bhavnagar    | -                | 30.00                | -                      | 35.00                |
| Jamnagar     | 38.00            | -                    | 40.00                  | -                    |
| Nadiad       | -                | 38.00                | -                      | 52.00                |
| Junagadh     | 78.00            | -                    | 75.00                  | -                    |
| Porbandar    | 62.00            | -                    | 57.00                  | -                    |
| Bharuch      | -                | -                    | 96.00                  | -                    |
| Navsari      | 82.00            | 82.00*               | 63.00                  | 74.00                |
| Veravalpatan | 57.00            | -                    | 59.00                  | -                    |

\* The system is combined.

The three corporations of Surat, Bhavnagar and Jamnagar are not being served well either by surface drainage or by the underground sewerage system. As shown above, only 27 per cent of the city's area in Surat, 30 per cent of Bhavnagar, and 38 per cent of Jamnagar are being served by either of the two systems. On the other hand, the coverage of the systems in cities such as Ahmedabad, Vadodara, Junagadh, and Navsari appears to be satisfactory.

Roads

Adequate provision of surfaced roads for the movement of men and materials is an essential function of every urban local body.

It is rightly stated that roads constitute the lifeline of towns and cities. In the 58 municipal areas of Gujarat state, the total road length available is estimated to be 5548.77 km. in length of which almost 70 per cent is surfaced while the rest is unsurfaced.

The comparison of developed area with the area of roads under circulation presents quite an unsatisfactory picture in that the per cent area under circulation is much lower than even the lower limit of the norms set therefore. Only type B municipalities have a somewhat better position but that is so partly due to the lower percentage of developed area to total area. Another feature that emerges from Table - 18 is that city size and the road network are positively co-related. This shows that the road mileage on an area basis is the highest in the case of corporation (6.75 km.) which declines consistently as the size category of towns decreases. It is the lowest in class C towns.

Table - 18

Extent of Area Under Circulation

| Category    | Total area (sq. km.) | Total road length (km.)<br>sq. km. | Surfaced road/sq. km. (km.) | % to total | Unsurfaced roads/sq. km. (km.) | % to total | No. of local bodies | Total area (sq. km.) | Developed area (sq. km.) with % to total area | Area under circulation sq. km. with % to developed area. |
|-------------|----------------------|------------------------------------|-----------------------------|------------|--------------------------------|------------|---------------------|----------------------|---|--|
| Corporation | 447.15               | 3024.48<br>(6.76)                  | 5.42                        | 80.25      | 1.33                           | 19.75      | 4                   | 240.74               | 96.46<br>(40)                                 | 8.54<br>(8.87)   |
| Class A     | 109.19               | 482.92<br>(4.42)                   | 2.80                        | 63.37      | 1.62                           | 36.63      | 6                   | 109.19               | 50.44<br>(46)                                 | 4.09<br>(8.10)   |
| Class B     | 319.31               | 1377.84<br>(3.95)                  | 2.23                        | 56.54      | 1.71                           | 43.46      | 20                  | 291.33               | 106.76<br>(36)                                | 11.41<br>(10.68)   |
| Class C     | 297.07               | 663.53<br>(2.47)                   | 1.45                        | 58.86      | 1.01                           | 41.13      | 19                  | 227.45               | 92.73<br>(41)                                 | 5.51<br>(5.94)   |
| All         | 1172.72              | 5548.77<br>(4.73)                  | 3.32                        | 70.33      | 1.41                           | 29.67      | 49*                 | 868.71               | 346.19<br>(40)                                | 29.55<br>(8.53)  |

\* Data for 9 towns are not available.

The extent of road coverage and its adequacy can be seen from the fact that about 50 per cent of the urban local bodies have less than four km. of roads for every sq. km. of the town's area. Only about less than one fifth of the municipal areas have road lengths exceeding 8.1 km./sq.km. What is interesting is that even among the corporations and class A municipalities there are at least three (out of a total of 12) that have 2.1 to 4.0 km./sq.km. of roads, and another three between 6.1 and eight km./sq.km. of roads. These could not be said to be satisfactory levels by any standard.

Table - 19

| Roads/Sq.km. by Size Class      |             |         |         |         |     |            |
|---------------------------------|-------------|---------|---------|---------|-----|------------|
| Municipal roads/sq.km. (in km.) | Corporation | Class A | Class B | Class C | All | % to total |
| 0.1-2.0                         | -           | 1       | 3       | 6       | 10  | 17.24      |
| 2.1-4.0                         | 2           | 1       | 8       | 7       | 18  | 31.06      |
| 4.1-6.0                         | 1           | 1       | 8       | 2       | 12  | 20.68      |
| 6.1-8.0                         | 1           | 2       | 3       | 2       | 7   | 12.06      |
| 8.1-10.0                        | 2           | -       | 4       | 2       | 8   | 13.79      |
| 10.1 & above                    | 1           | 1       | 1       | -       | 3   | 5.17       |
| All                             | 6           | 6       | 27      | 19      | 58  | 100.00     |

Primary Education

Provision of educational facilities at all levels of life as an essential social infrastructure is necessary to supplement the economic infrastructure created through various development plans. Education holds the key to the overall development of the

society and the state. Government has been giving a high priority for the development of education especially primary education. During the period of the Sixth Five Year Plan 1980-85, emphasis was laid on equalising education opportunities and making education relevant. Primary education was included in the Minimum Needs Programme. The national norms for enrolment during the Sixth Five Year Plan 1980-85, was 95 per cent for the age group of school-going children against the existing position of 77 per cent enrolment in that age group on the basis of 1983-84 figures.

The classwise enrolment in the primary schools in urban Gujarat during the year 1983-84 is given in Table 20. The per cent enrolment in the primary schools to the total school-going population varies significantly from one class of localbody to another, ranging from 72.10 per cent in corporations to 88.75 per cent in class C municipalities. The negative correlation is noticed between the size of municipalities and enrolment in primary education. This is perhaps due to a very large number of students enrolled in the non-municipal schools, particularly in the larger cities.

Table - 20  
Primary Education Enrolment by Size Class

| Category     | Estimate population (1983-84) | Enrolment (1983-84) | % Enrolment to estimated population |
|--------------|-------------------------------|---------------------|-------------------------------------|
| Corporations | 770,406                       | 555,494             | 72.10                               |
| Class A      | 113,363                       | 90,747              | 80.04                               |
| Class B      | 276,590                       | 238,692             | 86.29                               |
| Class C      | 116,178                       | 103,113             | 88.75                               |
| All          | 1276,537                      | 988,046             | 77.40                               |

Fifty-two students on an average are accommodated in one classroom on the basis of the existing position of classrooms against the accepted norm of 40 students per classroom. However, this figure varies significantly from one class of local bodies to another ranging from 50.9 in class C local bodies to 59.5 in class A local bodies.

Table - 21

Student-Classroom Ratio by Size Class

| Category     | Existing number of classrooms (1983-84) | Number of students per classroom |
|--------------|---|----------------------------------|
| Corporations | 10,867                                  | 51.1                             |
| Class A      | 1,524                                   | 59.5                             |
| Class B      | 4,511                                   | 52.9                             |
| Class C      | 2,023                                   | 50.9                             |
| All          | 18,925                                  | 52.2                             |

The student-teacher ratio is given in Table 22.

Table - 22

Teacher-Student Ratio by Size Class

| Category    | Number of students per teacher |
|-------------|--------------------------------|
| Corporation | 38                             |
| Class A     | 31                             |
| Class B     | 45                             |
| Class C     | 63                             |
| All         | 41                             |

The average number of students per teacher works out to 41 ranging from 31 in Class-A to 63 in class C local bodies. This figure corresponds to the norms laid down in the Sixth Five Year Plan which gives the teacher-pupil ratio as 1:38 and 1:40.

#### IV STANDARDS AND NORMS

The question as to what levels of services ought to be provided and maintained in urban areas of various sizes, dimensions and economic specialisation is not new in urban planning literature. It has been long debated both in India and outside, with experts and practitioners often recommending even the minutest details about the quantitative and qualitative standards of services such as water supply, roads, education and so forth. Some idea of this can be had from the fact that the Central Public Health and Environmental Engineering Organisation (CPHEEO), in proposing the norms for water supply, worked out detailed estimates for domestic needs (drinking, cooling, bathing, washing, flushing of toilets, gardening and individual air conditioning), institutional needs (hospitals, hotels, hostels, restaurants, airports and seaports, stations, offices, factories etc.), public purposes (street washing and watering, flushing of sewers, watering of public parks), industrial and commercial uses, fire-fighting, likely waste among users, and other uses! Standards for quality of water have been added with identical details. Similar is the case for other basic urban services.

What is important in the efforts of CPHEEO and other similar organisations and committees is that the standards as proposed by them have tended to represent the "most desirable levels of services" - a kind of optima, rather than the levels that would be within the reach of the urban localbodies. Very few local

bodies have been able to attain the standards of services as proposed by CPHEEO, or the Zakaria Committee, or the Town and Country Planning Organisation. More often, it has been the constraint of resources which has prevented the governments and local bodies from maintaining such high standards in the provision of services.

An equally significant factor which is becoming increasingly important in India as in other developing countries is that while it has been found possible to provide or instal higher levels of services (such as a per capita water supply of 200 ltrs/day with an underground sewerage system for medium-sized towns), the urban local bodies have not been able to efficiently and effectively maintain them. They have been unable to meet the prohibitively high operational expenses. In fact, there are many instances where services remain underutilised and even go into disuse for want of adequate operational funds.

Thus, there is, at present, greater pragmatism in the field of determining standards or norms for particularly the most basic municipal services and facilities, such as water supply, sewerage, roads, and primary education. The increasing numbers of the poor in the urban areas and their inability to pay even small amounts for the services has contributed significantly to this pragmatism.

Evidently enough, the norms for services are governed by demand and supply forces. On the demand side is the population factor, the number, the rate of increase, its composition by age, occupation and activities, the income brackets and so on. Any

change in either the number of its composition can effectively alter the demand for a given service. The supply side is represented by the availability of funds, both capital and operational, not only at a point of time but over a period of time. As mentioned earlier the prerequisite for issuing any service effectively is the availability of operational funds on a recurring basis. Also, the selection of a system such as a water supply system or a road network will depend on the accessibility of an urban local body to capital resources. Apart from these, there are the localised factors such as the topography, type of region, and so on which may also influence the determination and eventual selection of a particular standard or type for a service.

Reference may be made here to the general guidelines which the Zakaria Committee kept in view for evolving the standards of urban services. It reads as under :

In evolving the standards for various grades of townships the important consideration has been the means of the local body to finance and maintain a particular standard of service. The financial position of many local bodies to undertake capital projects are limited and under these circumstances it will become a unworkable proposition if a standard is recommended which will involve subsidies. But the standards suggested here take into account the minimum needs for various purposes to maintain environmental hygiene to a desirable level. For instance in a small town with a population of say about 10,000 it may not be necessary to provide a higher per capita of water supply since it would be possible to meet certain water uses such as gardening, washing of clothes etc. from local sources such as wells, rivers etc., which in the case of bigger towns will have to be provided from the piped water supply. In a bigger city more water is required for public uses such as road washing, maintenance of huge public open spaces, needs of public institutions and hotels, and for fire fighting etc. In a small town such needs are very much limited. So the differences in standards of services in the hierarchy of towns are based on the actual essential needs. Besides the economic implications of the use of urban land whose value is very high in the case of bigger cities have been taken into account in prescribing standards for certain elements of development. For instance in the case of metropolitan

cities where land values are very high and where the availability of land is scarce, mechanical treatment of sewerage has been suggested, whereas, in the case of small towns land treatment has been prescribed since plenty of land would be available there at cheaper rates. In addition there is an economic size of population for recommending mechanical treatment plants and it may be beyond the means of small local bodies to maintain such plants which will require staff with higher technical expertise. Similarly in the case of storm water drainage, covered drains have been recommended for bigger cities to restrict the size of the drain as compared to small towns where open drains could suffice.

In determining the norms for the study, a three-stage analysis has been carried out. The first stage consisted of an examination of the standards proposed by the Zakaria Committee and other organisations such as the Town and Country Planning Organisation and CPHEEO. In the second stage, these standards were juxtaposed with the existing levels of services (as given in the preceding chapter), with the objective of ascertaining as to how large the gap was between the existing levels and the desirable levels proposed by the various committees and organisations, and whether the urban local bodies were in a position to bridge this gap within a given time frame. The third stage consisted of taking a final view on what norms should be prescribed for the various services as far as this study was concerned. In taking a final view, consideration was given to the following factors :

- i. Norms should reflect the needs of the various sizes and types of towns and cities. These should also take into account the constraints that the locations of the various towns may impose on the norms.
- ii. Norms should be attainable within a given time frame.
- iii. Norms should generally be low-cost and affordable.

As stated earlier, an examination of the proposals made by various committees and organisations constituted the first step in determining the norms and standards for the various services. Only a few facts of this examination relevant to the four services are presented here.

Water Supply

Among the four services, the one on water supply has been dealt with most extensively in literature. The Zakaria Committee and the Central Public Health and Environmental Engineering Organisation (CPHEEO) have made specific recommendations on the per capita requirements of water supply which are reproduced in Table 23.

Table - 23

Norms for Water Supply

(lpcd)

| The Zakaria Committee     |              | The CHPEEO's Manual |              |
|---------------------------|--------------|---------------------|--------------|
| Size (population)         | Water Supply | Size (population)   | Water Supply |
| A. Special<br>(2000,000+) | 270          | 50,000+             | 125-200      |
| A. 500,000-5000,000       | 202.5        | 100,00-50,000       | 100-125      |
| B. 100,000-500,000        | 157.5        | less than 10,000    | 70-100       |
| C. 50,000-100,000         | 122.5        |                     |              |
| D. 20,000-50,000          | 67.5         |                     |              |
| E. Less than 20,000       | 45.0         |                     |              |

### Sewerage

The CHPEEO and the Zakaria Committee have recommended more specifically the types of systems for treatment of sewage. No clear directions are available on whether underground sewerage systems should be recommended for installation in cities of all sizes or whether these should be put in only larger cities. The CHPEEO has, however, proposed that underground sewers should be designed for a minimum of 150 ltrs. of water supply per capita per day. It is also stated that not more than 80 per cent of the water supply should be expected to reach the sewers, which means that such systems should be recommended for cities which have per capita daily water supplies of approximately 187 litres.

### Roads

As in the case of sewerage the norms proposed for roads relate more to road widths and access standards rather than to the overall area that should be earmarked for roads and circulation. For instance, the Town and Country Planning Organisation has suggested walking distances to schools, recreations points, health centres etc. which are extremely important in the Master Planning exercises. The Zakaria Committee's recommendations are also of the same view.

### Schools

The Seventh Five Year Plan (1985-90) has suggested that by the end of the Plan period, an overall enrolment of 93 per cent should be attained for primary education, covering 6-14 years of age-group.

Existing levels of services have been discussed at length in the previous chapter, and here only a brief recapitulation is made in order to draw comparisons with the levels proposed by various committees and organisations.

Table - 24  
Water Supply - Present Situation

| Size<br>(population)       | The Zakaria<br>Committee | CPHEEO  | RN  | (lpcd)                      |       |
|----------------------------|--------------------------|---------|-----|-----------------------------|-------|
|                            |                          |         |     | Existing<br>levels<br>Total | Gaps* |
| Corporations<br>(200,000+) | 202.5 )                  |         | 175 | 169.1                       | 5.9   |
| 100,00-200,000 )           | 157.5 )                  | 125-200 | 145 | 99.2                        | 45.8  |
| 50,000-100,000 )           | 112.5 )                  |         | 120 | 91.6                        | 28.4  |

Recommended Norms

A. Water Supply (Terminal year 2011)

Table - 28

Water Supply : General

|                            | (lpcd)  |     |                            |               |
|----------------------------|---------|-----|----------------------------|---------------|
| Size (population)          | Overall | RN  | Towns with industrial base | Problem towns |
| MC and towns with 200,000+ | 135-210 | 175 | 200-210                    | 125           |
| 100,000-200,000            | 115-170 | 145 | 170                        | 120-125       |
| 50,000-100,000             | 80-150  | 120 | 150                        | 90            |
| 20,000- 50,000             | 75-125  | 100 | -                          | -             |

RN = Recommended Norms

1. It is assumed that the requirements of water supply in towns with industrial base would be 1.25 times larger than in other towns.
2. Problem towns are those which are located in water-scarcity zones. These include - Rajkot, Bhavnagar, Jamnagar, Dhoraji, Godal, Jetput, Amreli, Upleta, Botad, Sawarkundla, Mangrol and Limbdi.
3. A technical note is also appended in this regard in Annexure-2.

Table - 29

Water Supply : Slums

|                            | (lpcd)  |               |
|----------------------------|---------|---------------|
| Size (population)          | Overall | Problem towns |
| MC and towns with 200,000+ | 100     | 70            |
| 100,000- 50,000            | 90      | 60            |
| 50,000-100,000             | 80      | 55            |
| 20,000- 50,000             | 80      | 55            |

B. Underground Sewerage (Terminal year 2011)

Table - 30

Underground Sewerage

| Size (population)                    | Norms  |
|--------------------------------------|--|
| MC and towns with 100,000 population | 100% population coverage except for percentage of slum population. |
| 50,000-100,000                       | Only those towns which already have sewerage system.*              |
| 20,000- 50,000                       | Low cost sanitation system.  |

\* Other towns may adopt an appropriate method relating to low cost sanitation.

C. Roads (Terminal year 2001)

Table - 31

Percentage of Roads to Total Developed Areas

| Size (population)       | <u>*Gradual upgradation of the road network</u> |      | Pucca to total roads |
|-------------------------|---|------|----------------------|
|                         | 1991  | 2001 |                      |
| Corporations (200,000+) | 20  | 25   | 80                   |
| 100,00-200,000          | 15  | 20   | 70                   |
| 50,000-100,000          | 12  | 15   | 65                   |
| 20,000- 50,000          | 10  | 15   | 60                   |

\* The gradual upgradation is determined by existing roads 1000 persons/km to be such that does not overspill the percentages shown against each category of local body.

D. Education (Class I to V, age group 6 to 11 years - Terminal year 2001)

Table - 32

Primary Education

(percentage)

| Year | Children in the reference age group to total population | Enrolment of children in 6-11 years | Share of non-municipal schools |
|------|---|-------------------------------------|--------------------------------|
| 1991 | 19.9  | 93                                  | 20                             |
| 2001 | 16.9  | 93                                  | 20                             |

In addition to the standards and norms for services norms for the unit cost of adding to the services have also been established. Unit costs proposed below are at constant prices.

A. Water Supply

Table - 33

Water Supply : Per Capita Unit Cost

(Rs.)

| Size            | Capital cost*       |                         | Operating Cost**         |
|-----------------|---------------------|-------------------------|--------------------------|
|                 | Unit cost (general) | Unit cost problem towns | Average unit cost annual |
| MC and 200,000+ | 300 to 350          | 600 to 700              | 29                       |
| 100,000-200,000 | -do-                | -do-                    | 22                       |
| 50,000-100,000  | -do-                | -do-                    | 12                       |
| 20,000- 50,000  | -do-                | -do-                    | 11                       |

\* Unit cost for 150 lpcd approximately. In both the cases the average unit cost has been taken as norms such as Rs. 325 for general category and Rs. 650 for problem towns.

\*\* This rate applies to problem towns also as the per capita cost in these towns works out to be much less than the above cost mainly due to lower existing actual water supply levels.

B. Sewerage

Table - 34

Sewerage and Garbage Collection : Per Capita Unit Cost

| Size<br>population           | (Rs.)                             |  |   |
|------------------------------|-----------------------------------|--|---|
|                              | Capital cost<br>Average unit cost |  | Operating cost<br>Average unit cost<br>annual |
|                              | Sewerage                          |  | Sewerage Garbage*                             |
| MCD & towns<br>with 200,000+ | 400 to 450                        |  | 19 18   |
| 100,000-200,000              | -do-                              |  | 18 14   |
| 50,000-100,000               | -do-                              |  | 6 11  |
| 20,000- 50,000               | -do-                              |  | 10 8  |
| Low cost sanitation          | 300 to 350                        |  | - -   |

\* The per capita cost of garbage collection is high as it includes the cost of tools and implements also.

C. Roads

Table - 35

Roads : Cost Per Km.

| Size<br>(population)   | (Rs.)                          |                             |                              |
|------------------------|--------------------------------|-----------------------------|------------------------------|
|                        | Pucca roads                    |                             | Kuchha roads<br>capital cost |
|                        | Capital*<br>cost<br>(in lakhs) | Annual<br>operating<br>cost |                              |
| MC & towns<br>200,000+ | 7.5                            | 60,000                      | 40,000                       |
| 100,000-200,000        | 5.0                            | 40,000                      | -do-                         |
| 50,000-100,000         | 4.0                            | 30,000                      | -do-                         |
| 20,000- 50,000         | 3.0                            | 20,000                      | -do-                         |

\* This is good for even the towns in heavy rain prone area of South Gujarat where the high material cost balances the high labour cost in other (Saurashtra Region) towns.

D. Education

Table - 36

Primary Education : Cost

|                               | (Rs.in lakhs)                          |
|-------------------------------|--|
| Size<br>(population)          | Annual operating cost/1000<br>students |
| MC & towns with<br>(200,000+) | 3.15                                   |
| 100,000-200,000               | 2.95                                   |
| 50,000-100,000                | 2.15                                   |
| 20,000- 50,000                | 2.64                                   |

Capital cost/class room Rs.50,000 for a room of 18'x22'

V GUJARAT'S MUNICIPAL SERVICES  
A LONG RANGE PERSPECTIVE

1. A brief recapitulation of the purpose of the study is called for at the outset of this chapter. The study's main purpose was to make an estimate of the total requirements of the four basic services of the 58 towns and cities of the Gujarat State, for the year 2011 AD in the case of water supply, and sewerage, and 2001 AD for roads and education.<sup>1</sup> The purpose was to also make an estimate of the requirements of financial resources, both capital and operating, for meeting the basic services needs of these towns.

2. The study involved essentially three steps, namely:

- i. making estimates of population of these 58 towns and cities for the years 1991, 2001 and 2011;
- ii. determining norms of services for the years under reference
- iii. deciding upon the unit costs for adding to the existing stock and flow of services.

Details of the three steps have been given in the earlier chapters and therefore, only such details as are necessary for purposes of estimation will be referred to here.

3. According to the population projections (the preferred (ORG) model), the total population of the 58 towns and cities will increase to 12.2 million by the turn of the century (the year 2001 A.D.) and 15 million by the year 2011. Though the share of

---

1. A longer time frame for water supply and sewerage was considered necessary as provision of these services often requires an integrated or quasi-integrated system. Planning for such a system requires a longer time frame. As against these smaller increments are possible to roads and education services as those happen to be largely divisible.

these towns in the total urban population is expected to decline with the passage of decades (as the urban base would expand), these towns will assume greater demographic significance in the State on account of their larger size. As may be seen in Table 37 there will be eight (as against six as of today) towns and cities with a population of 200,000+ and 18 cities in the size category of 100,000-200,000 population in 2001.

Table - 37  
Population Estimates - 2001 & 2011

| Size<br>(population) | 1981            |                            | 2001            |                            | 2011            |                            |
|----------------------|-----------------|----------------------------|-----------------|----------------------------|-----------------|----------------------------|
|                      | No. of<br>towns | Popula-<br>tion<br>( '000) | No. of<br>towns | Popula-<br>tion<br>( '000) | No. of<br>towns | Popula-<br>tion<br>( '000) |
| 200,000+             | 6               | 4,601                      | 8               | 7,617                      | 11              | 10,036                     |
| 100,000-200,000      | 6               | 699                        | 18              | 2,372                      | 27              | 3,612                      |
| 50,000-200,000       | 24              | 1,515                      | 27              | 2,019                      | 17              | 1,296                      |
| 50,000               | 22              | 944                        | 5               | 207                        | 3               | 128                        |
| Total                | 58              | 7,709                      | 58              | 12,215                     | 58              | 15,072                     |

A second aspect that has a direct bearing upon the estimation of services is related to the area of 58 towns and cities and in this regard it is assumed that the total area of towns and cities as also the developed area will not undergo any changes. The details of area by size class of towns is given in Table 38.

Table - 38  
Percentage of Developed Area

| Size<br>(population)       | 1982-83                |   |
|----------------------------|------------------------|---|
|                            | Total area<br>(Sq.Km.) | Developed area<br>as % of<br>total area |
| Corporations<br>(200,000+) | 447.15                 | 40                                      |
| 100,000-200,000            | 109.19                 | 46                                      |
| 50,000-100,000             | 348.01                 | 36                                      |
| 20,000- 50,000             | 268.37                 | 41                                      |
| Total                      | 1,172.72               | 40*                                     |

\* Data relates to only 49 towns.

The third aspect relates to the estimated number of children in the 6-11 age-group by the terminal year of the study (2001). According to the 1983-84 age-tables, 16.5 per cent of the total urban population of Gujarat was in the relevant age-group for primary education. As per the estimate made on the basis of the findings on the age-wise returns made by the Expert Group on Population set up by the Planning Commission, more or less then same percentage (16.9) is expected to persist at least in the decade between 1991-2001, and 19.9 per cent for the intermediate year 1991. The total number of children needing primary education will be 2,064,355 (Table 39).

Table - 39

Estimated population in age-group 6-11 years

| Years      | 1983-84<br>population | % to total<br>population<br>of 58 towns | 2001<br>Estimated<br>population | Estimated<br>enrolment as<br>per the 7th*<br>Five Year Plan |
|------------|-----------------------|---|---------------------------------|---|
| 6-11 years | 12,79,800             | 16.5                                    | 2,064,335                       | 1,919,831   |

\* Seventh Five Year Plan for Gujarat State envisages 93 per cent enrolment of the reference age group for primary education. The same has been kept for the year 2001.

Water Supply

The estimated total requirements of water supply in the terminal year (2011) for the 58 municipalities and corporation work out to be 2544.81 (mld). However, the existing capacities (actual supply) are only 1176.05 (mld). Thus the gap during the terminal year works out to 1368.76 (mld) of water supply. (Table - 47)

Table 48 indicates the additional requirements for each town in terms of both investment and maintenance purposes. In the terminal year 1.e. 2011 all the towns require capital support for investment purposes for augmenting the existing system. Similarly in case of maintenance gap, all the towns except Anjar will need a substantial amount varying from Rs.34,000 to 6,79,30,000 (Table 49A)

All the 58 towns require additions in their existing systems varying from .30 mld to 267.25 mld in order to make them able to meet the requirements at the level of 2011 AD (Table - 48).

Only in case of Rajpipla it was found that the presently utilized capacity will be able to meet the requirements up to 2001. However, this town also will need an augmentation from 2001 onwards.

Three towns namely Palanpur, Ankleshwar and Anjar do not seem to have maintenance gap in the year 1991 owing to the better level of their per capita income which is Rs. 17, 12 and 13 respectively. This income is slightly higher than the respective class average taken as a norm for projecting maintenance requirements in these towns. However, in 2001 only one town i.e. Anjar maintains this ability to not to have a gap for operating cost.

Table 40 gives the cumulative requirements of financial resources for providing water supply of the above magnitude for maintaining the population level of 2011.

Table - 40

Water Supply : Financial Requirements by Size Class by 2011.

| Size class                | (Rs. in lakhs)   |                    |
|---------------------------|------------------|--------------------|
|                           | Capital          | Operating (Annual) |
| MC and towns with 200,000 | 21,469.50        | 1997               |
| Class A                   | 7,574.18         | 608                |
| Class B                   | 4,947.26         | 82                 |
| Class C                   | 499.66           | 10                 |
| <b>Total</b>              | <b>34,490.60</b> | <b>2,697</b>       |

Sewerage

According to the norms proposed in the preceding chapter, 48 towns should be eligible for underground sewerage system. The distribution of these towns by size is given below in Table 41.

Table - 41  
Sewered Towns by 2011

| Size (population)       | Total number |
|-------------------------|--------------|
| Corporations (200,000+) | 11           |
| 100,000-200,000         | 27           |
| 50,000-100,000          | 8            |
| 20,000- 50,000          | 2            |
|                         | 48           |

According to Table 49 A which gives the details of costs on a town-wise basis, the total capital resources required to cover these towns with underground sewerage will amount to Rs. 320.2 crores. The summed up results are indicated in Table 42.

Table - 42  
Underground Sewerage : Financial Resources Requirement  
by Size Class by 2011

| Size class              | (Rs. in lakhs) |                    |
|-------------------------|----------------|--------------------|
|                         | Capital        | Operating (Annual) |
| MC & towns with 200,000 | 8011.2         | 3,713.32           |
| Class A                 | 394.00         | 1,155.84           |
| Class B                 | 595.20         | 220.32             |
| Class C                 | 72.00          | 23.04              |
| Total                   | 9072.4         | 5,112.52           |

Roads

Table 43 deals with the cost of laying new roads and maintaining them along with the already existing stock. The road lengths in the year 2001 elevate the level of percentage of roads under circulation to total developed urban area from 8 to 16 at a cost of Rs.287.84 crores.

Table - 43

Roads : Financial Resources Requirements by Size Class by 2001

(Rs. in lakhs)

| Size class               | Financial resource requirements |                      |
|--------------------------|---------------------------------|----------------------|
|                          | Capital                         | Maintenance (Annual) |
| MC & towns with 200,000+ | 19050.99                        | 3045.41              |
| Class A                  | 2921.93                         | 459.48               |
| Class B                  | 2572.46                         | 323.55               |
| Class C                  | 353.97                          | 36.53                |
| Total                    | 24919.35                        | 3864.97              |

Education

Table 44 gives the financial requirements to bring into the fold of education, 1.5 million children, expected to go to municipal schools for primary education by the turn of the century. As per the target of 93 per cent coverage of school-going children set in the Seventh Plan, it was felt that out of this 20 per cent of the children are likely to go to public schools and proportion of the school-going children (municipal schools) has been worked out accordingly at a cost of Rs.92.43 crores.

Table - 44

Education : Financial Resources Requirement  
by Size Class by 2001

(Rs. in lakhs)

| Size class               | Financial resources requirement |                                   |

ANNEXURE - 1

National Institute of  
Urban Affairs  
New Delhi regarding entrusting  
a study of \_\_\_\_\_

GOVERNMENT OF GUJARAT  
URBAN DEVELOPMENT & URBAN HOUSING DEPTT.,  
RESOLUTION NO: MFB-1083-1545-F,  
DATED: 12-1-84

Read:- Letter No. Chairman/CCD-2-4120,dt. 28-10-83 from the  
Chairman, Gujarat Municipal Finance Board.

R E S O L U T I O N  
- - - - -

The Government is pleased to accord the sanction to the Chief Executive Officer, Gujarat Municipal Finance Board, to entrust to the National Institute of Urban Affairs, New Delhi, a study to determine the expected level of Services (Water Supply and Drainage System, Road and Primary Education), in the Municipalities of the State by classifying the Municipalities in suitable categories or otherwise, and to work out, on scientific basis, their financial requirement for upgrading the level of services to the said expected levels after taking into consideration the present levels of these services in the Municipalities and to pay Rs. 2.25 lakhs to the National Institute of Urban Affairs, New Delhi towards this.

The expenditure should be met from the interest income from the investment in Banks of the entertainment tax grant with the Gujarat Municipal Finance Board.

This issues with the concurrence of the Financial Advisor, vide his note dated 13-12-83 on this department file of even number.

By order and in the name of Governor of Gujarat,

Sd/-  
(GIRISH MEHTA)  
UNDER SECRETARY TO THE GOVERNMENT OF GUJARAT  
URBAN DEVELOPMENT & URBAN HOUSING DEPTT.,

To,

1. Chairman, Gujarat Municipal Finance Board, 119, Swastik Society, Navrangpura, Ahmedabad.
2. Chief Executive Officer, Gujarat Municipal Finance Board, Ahmedabad.
3. Accountant General - I, Gujarat, Ahmedabad.
4. Accountant General - II, Gujarat, Rajkot.
5. Director, Accounts and Treasuries, Ahmedabad.
6. Pay and Accounts Officer, Ahmedabad.
7. Treasury Officer, Ahmedabad.
8. Financial Advisor, Urban Development & Urban Housing Department, Sachivalaya, Gandhinagar.
9. Director of Bureau of Public Enterprises, Finance Department, Sachivalaya, Gandhinagar.
10. Select File.

ANNEXURE - 2

METHODOLOGY USED FOR WORKING OUT WATER SUPPLY GAP

In accordance with the study objectives the water supply requirements are worked out for augmenting the existing capacities in urban Gujarat in order to meet the requirements in a long range i.e. 2011 A.D. The following norms have been determined for projecting the water-supply requirements in different size class of towns in consultation with GMFB and taking into account the various norms prescribed by different committees and agencies.

Water Supply : Recommended norms

| Size (Population)                    | Overall       | Pre-dominantly Industrial Town | Problem Town  |
|--------------------------------------|---------------|--------------------------------|---------------|
| MC + Towns with 200,000 + population | 135-210 (175) | 200-210 (205)                  | 125           |
| 100,000-200,000                      | 115-170 (145) | 170                            | 120-125 (123) |
| 50,000-100,000                       | 80-150 (120)  | 150                            | -             |
| 20,000-50,000                        | 75-125 (100)  | -                              | -             |

( ) Figures within the brackets indicate the average value.

Total quantity required is calculated on the basis of recommended norms-average value incase of a range. However, the net requirement is derived by subtracting the actual supply from the total requirements on the assumption that the present supply (1982-83) represents the optimum capacity utilization. Thus, the basis for arriving at net requirement (NR) is :

$$NR = TR - AS$$

Where as

TR = Projected Population x recommended norm (Table-45A)

AS = Actual Supply (Table-45A)

#### Investment Requirements (IR)

Investment requirements for augmenting the present system in each city are worked out on the basis of capital cost @ Rs. 300-500 for 150 lpcd approximately for all sizes of towns except the problem towns. In case of problem towns the capital cost is taken as Rs. 600-650 per 150 lpcd approximately (Table-49A). Thus the Investment requirement which are non-recurring in nature are worked out as

$$IR = NR \times Cc$$

Where as

NR = Net requirement

Cc = Capital Cost (Average value has been taken in case of a range).

#### Additional Maintenance Requirements (AMR)

The main idea behind this perspective planning is to augment the system at a level upto the terminal year 2011 A.D. However capacity utilization during this period will vary in a gradual way depending upon the increase in population. Owing to the fact that the existing user-charges and other cost recovery mechanisms lead to a negative income-expenditure differential at a high degree, the maintenance gap in water supply service is worked out on following basis :

$$AMR = Pp \times AE - IWS \times Pp$$

$$\text{Or } AE - IWS \times Pp$$

Where as

AE = Per capita ordinary expenditure on water supply  
[(Arithmetic mean of respective size class : (Table -  
33)].

IWS= Per capita income from water supply through user  
charges and water tax in each town in 1982-83 (Table-  
45).

Pp = Projected population.

The years 1991, 2001 and 2011 are taken as reference year for the purpose of working out operating cost and subsequent gap by subscribing the per capita income from water supply sources assuming that the cost-recovery mechanisms will remain same. In other words the maintenance gap, thus, worked out does not include the inflationary trends and its possible implications.
